

## Proof

for all integers  $n$ , if  $n$  is even, then  $n^2$  is even

formal proof – write as an argument and explicitly state each step

$n$ is even $\therefore n^2$ is even	<p>Let <math>n</math> be an arbitrary integer.</p> <ol style="list-style-type: none"> <li><math>n</math> is even premise</li> <li>if <math>n</math> is even, then <math>n = 2k</math> for some integer <math>k</math> definition of even</li> <li><math>n = 2k</math> for some integer <math>k</math> from 1, 2 (<i>modus ponens</i>)</li> <li>if <math>n = 2k</math> for some integer <math>k</math>, then <math>n^2 = 4k^2</math> for that integer <math>k</math> basic algebra</li> <li><math>n^2 = 4k^2</math> for some integer <math>k</math> from 3, 4 (<i>modus ponens</i>)</li> <li>if <math>n^2 = 4k^2</math> for some integer <math>k</math>, then <math>n^2 = 2(2k^2)</math> for that <math>k</math> basic algebra</li> <li><math>n^2 = 2(2k^2)</math> for some integer <math>k</math> from 5, 6 (<i>modus ponens</i>)</li> <li>if <math>n^2 = 2(2k^2)</math> for some integer <math>k</math>, then <math>n^2 = 2k'</math> for some integer <math>k'</math> basic fact about integers</li> <li><math>n^2 = 2k'</math> for some integer <math>k'</math> from 7, 8 (<i>modus ponens</i>)</li> <li>if <math>n^2 = 2k'</math> for some integer <math>k'</math>, then <math>n^2</math> is even definition of even</li> <li><math>n^2</math> is even from 9, 10 (<i>modus ponens</i>)</li> </ol>
---	---

Proof. Let  $n$  be an arbitrary integer.

<ol style="list-style-type: none"> <li><math>n</math> is even premise</li> <li><math>n = 2k</math> for some integer <math>k</math> definition of even</li> <li><math>n^2 = 4k^2</math> for that integer <math>k</math> basic algebra</li> <li><math>n^2 = 2(2k^2)</math> for that <math>k</math> basic algebra</li> <li><math>n^2 = 2k'</math> for some integer <math>k'</math> substituting <math>k' = 2k^2</math></li> <li><math>n^2</math> is even definition of even</li> </ol>	<p>Since <math>n</math> was an arbitrary integer, the statement is true for all integers. <math>\square</math></p>
---	--

## Proof

for all integers  $n$ , if  $n$  is even, then  $n^2$  is even

less formal – leave out explicit implications and instances of *modus ponens*

typical “formal” proof – written in prose, may not explicitly state all rules if reader can be expected to fill in those details

<p>Proof. Let <math>n</math> be an arbitrary integer.</p> <ol style="list-style-type: none"> <li><math>n</math> is even premise</li> <li><math>n = 2k</math> for some integer <math>k</math> definition of even</li> <li><math>n^2 = 4k^2</math> for that integer <math>k</math> basic algebra</li> <li><math>n^2 = 2(2k^2)</math> for that <math>k</math> basic algebra</li> <li><math>n^2 = 2k'</math> for some integer <math>k'</math> substituting <math>k' = 2k^2</math></li> <li><math>n^2</math> is even definition of even</li> </ol> <p>Since <math>n</math> was an arbitrary integer, the statement is true for all integers. <math>\square</math></p>	<p>Proof. Let <math>n</math> be an arbitrary integer and assume <math>n</math> is even. Then <math>n = 2k</math> for some integer <math>k</math> by the definition of even, and <math>n^2 = 4k^2 = 2(2k^2)</math>. Since the product of integers is an integer, we have <math>n^2 = 2k'</math> for some integer <math>k'</math>. Therefore <math>n^2</math> is even. Since <math>n</math> was an arbitrary integer, the statement is true for all integers. <math>\square</math></p>

## Discovering Proofs – Advice

- use the definition
  - e.g. a proof about even numbers likely needs to utilize the definition of “even”
- use the hypotheses
  - the *hypotheses* are the assumptions on which the conclusion will be based
  - previously-proved results can be used

CPS2 229: Foundations of Computation • Spring 2024 71

## Discovering Proofs – Patterns

- $\forall x P(x)$ 
  - tactic: let  $x$  be an arbitrary entity in the domain of discourse; show  $P(x)$  is true
    - showing  $P(x)$  for any entity means that it must hold for all entities
    - don't use any facts about  $x$  beyond what is assumed
- $\exists x P(x)$  – *existence proof*
  - tactic: find an example – a specific entity  $a$  for which  $P(a)$  is true
- disproving things
  - disprove  $\forall x P(x)$  with an example showing  $\exists x \neg P(x)$  – a *counterexample*
  - disprove  $\exists x P(x)$  by showing  $\forall x \neg P(x)$

CPS2 229: Foundations of Computation • Spring 2024 72

## Discovering Proofs – Patterns

- $p \rightarrow q$  aka  $\forall x (P(x) \rightarrow Q(x))$ 
  - tactic: assume  $p$ , show  $q$ 
    - $p \rightarrow q$  is true when  $p$  is false, so only need to handle the case where  $p$  is true
  - tactic: show a chain of valid implications  $p \rightarrow r \rightarrow s \rightarrow \dots \rightarrow q$
  - tactic: show the contrapositive ( $\neg q \rightarrow \neg p$ ) – *indirect proof*
- $p \wedge q$ 
  - tactic: show  $p$  and  $q$  separately
- $p \vee q$ 
  - tactic: assume  $\neg p$  and show  $q$  (based on  $p \vee q \equiv \neg p \rightarrow q$ )
- $p \leftrightarrow q$ 
  - tactic: show  $p \rightarrow q$  and  $q \rightarrow p$ 
    - in English:  $p$  if and only if  $q$ ,  $p$  is necessary and sufficient for  $q$
  - tactic: show a chain of valid biconditionals  $p \leftrightarrow r \leftrightarrow s \leftrightarrow \dots \leftrightarrow q$

3

4. Determine whether each of the following statements is true. If it true, prove it. If it is false, give a counterexample.
  - a) Every prime number is odd.
  - b) Every prime number greater than 2 is odd.
  - c) If  $x$  and  $y$  are integers with  $x < y$ , then there is an integer  $z$  such that  $x < z < y$ .
  - d) If  $x$  and  $y$  are real numbers with  $x < y$ , then there is a real number  $z$  such that  $x < z < y$ .
5. Suppose that  $r$ ,  $s$ , and  $t$  are integers, such that  $r$  evenly divides  $s$  and  $s$  evenly divides  $t$ . Prove that  $r$  evenly divides  $t$ .
6. Prove that for all integers  $n$ , if  $n$  is odd then  $n^2$  is odd.
7. Prove that an integer  $n$  is divisible by 3 iff  $n^2$  is divisible by 3. (Hint: give an indirect proof of “if  $n^2$  is divisible by 3 then  $n$  is divisible by 3.”)
8. Prove or disprove each of the following statements.
  - a) The product of two even integers is even.
  - b) The product of two integers is even only if both integers are even.
  - c) The product of two rational numbers is rational.
  - d) The product of two irrational numbers is irrational.
  - e) For all integers  $n$ , if  $n$  is divisible by 4 then  $n^2$  is divisible by 4.
  - f) For all integers  $n$ , if  $n^2$  is divisible by 4 then  $n$  is divisible by 4.
