

Computing Functions

Definition 5.2. Suppose that Σ and Γ are alphabets that do not contain # and that f is a function from Σ^* to Γ^* . We say that f is **Turing-computable** if there is a Turing machine $M = (Q, \Lambda, q_0, \delta)$ such that $\Sigma \subseteq \Lambda$ and $\Gamma \subseteq \Lambda$ and for each string $w \in \Sigma^*$, when M is run with input w , it halts with output $f(w)$. In this case, we say that M **computes** the function f .

$\Sigma = \{a\}$
computes $f(a^n) = a^{2n}$

Computable Languages

Definition 5.3. Let Σ be an alphabet that does not contain # and let L be a language over Σ . We say that L is **Turing-decidable** if there is a Turing machine $M = (Q, \Lambda, q_0, \delta)$ such that $\Sigma \subseteq \Lambda$, $\{0,1\} \subseteq \Lambda$, and for each $w \in \Sigma^*$, when M is run with input w , it halts with output $\chi_L(w)$. (That is, it halts with output 0 or 1, and the output is 0 if $w \notin L$ and is 1 if $w \in L$.) In this case, we say that M **decides** the language L .

Definition 5.4. Let Σ be an alphabet that does not contain #, and let L be a language over Σ . We say that L is **Turing-acceptable** if there is a Turing machine $M = (Q, \Lambda, q_0, \delta)$ such that $\Sigma \subseteq \Lambda$, and for each $w \in \Sigma^*$, M halts on input w if and only if $w \in L$. In this case, we say that M **accepts** the language L .

- Let $\Sigma = \{a\}$. Draw a transition diagram for a Turing machine that computes the function $f: \Sigma^* \rightarrow \Sigma^*$ where $f(a^n) = a^{3n}$, for $n \in \mathbb{N}$. Draw a transition diagram for a Turing machine that computes the function $f: \Sigma^* \rightarrow \Sigma^*$ where $f(a^n) = a^{3n+1}$, for $n \in \mathbb{N}$.
- Let $\Sigma = \{a, b\}$. Draw a transition diagram for a Turing machine that computes the function $f: \Sigma^* \rightarrow \Sigma^*$ where $f(w) = w^R$.
- Draw a transition diagram for a Turing machine which decides the language $\{a^n b^n \mid n \in \mathbb{N}\}$. (Hint: Change the a 's and b 's to S 's in pairs.) Explain in general terms how to make a Turing machine that decides the language $\{a^n b^n c^n \mid n \in \mathbb{N}\}$.
- Draw a transition diagram for a Turing machine which decides the language $\{a^n b^m \mid n > 0 \text{ and } m \text{ is a multiple of } n\}$. (Hint: Erase n b 's at a time.)
